

## Morphological Cladograms

A **cladogram** is a diagram used in cladistics to show relations among organisms. A cladogram is not, however, an evolutionary tree because it does not show how ancestors are related to descendants, nor does it show how much they have changed

**Morphology** is the branch of biology that deals with the form and structure (synapsid skull, warm blooded, notochord, unicellular, etc.) of organisms without consideration of function.

### Example:
